## Problem

When an external contractor (eg Beckhoff) need to dial in to a machine, it is often tricky to give them access if the password is not known. Some installs of Teamviewer have a randomly generated password set up, this document shows the settings to allow this.

## Solution

<p>Security Settings</p> <p>1 Enable One-Time Access Feature Click OFF</p>	 <p>The screenshot shows the 'TeamViewer options' window with the 'Security' tab selected. Under 'Options for access to this computer', the 'Unattended Access' section is expanded. The 'Enable One-Time Access feature' checkbox is circled in red. Other settings include 'Grant Gareth Green, Stuga Easy Access' checked, 'Random password (for spontaneous access)' with a strength of 8 characters, and 'Rules for connections to this computer' set to 'Allowed for all users'.</p>
<p>In the advanced settings</p> <p>2 Random Password After Each Setting Select "Generate New"</p>	 <p>The screenshot shows the 'TeamViewer options' window with the 'Advanced' tab selected. The 'Advanced settings for connections to this computer' section is expanded. The 'Random password after each session' dropdown menu is open, showing 'Generate new' selected. Other settings include 'Access Control' set to 'Full Access', 'Enable integrated system health checks' checked, and 'Ignore alpha blending on this computer' checked.</p>

3 This will give a random password for each session
